

Infratech Problem Solutions

Documentation Of our Project

- Over here our problems solutions prototype or we can say module is given as in a webapp here it is only have frontend as so far due to time limit
- As we have mentioned and explained our idea in PPT there is the kind of solution to that
- Here we have make a website where the core team and other employees at a certain respective deputy will have their unique user I'd no. And paasword now this will unique users are also in a way of leveling
- Here the boss user or a core team user will have access to every detail like overall ratio and graphs also If they want to know details and number from a particular department it is also possible.
- Also like core team user other user I'd given as their role and level and deputy in company the particular user have only access of details and inspection about only at his level or their below level users.
- As per our employees management as shown in PPT the ground level civil engineer will given the task by their senior teams and it dept and they don't have any privileges to access any kind of details of higher level here they have been given task by it dept which is designed by their senior team and they have to check each task and update it to their user I'd it will give data to it team and they can crosscheck that through inspection
- Here through this a person can easily get summary of how the work is going on project
